1 Review

1.1 Sequence

Theorem 1.1. $\sup(-x_n) = -\inf(x_n)$ and $\inf(-x_n) = \sup(x_n)$.

Proof. We know $\forall x_n \in \{x_n\}, \exists x$ s.t. $x \leq x_n \Rightarrow -x \geq -x_n$, i.e., $-x$ is the upper bound for $\{-x_n\}$ and x is the lower bound for $\{x_n\}$.

Besides, $\exists y$ s.t. $y = \sup(-x_n)$, i.e., $-x_n \leq y \leq -x \Rightarrow x \leq -y \leq x_n$. Hence, $-y = -\sup(-x_n)$ is the greatest lower bound for $\{x_n\}$ and wherefore

$$-\sup(-x_n) = \inf(x_n) \Rightarrow \sup(-x_n) = -\inf(x_n).$$

Similarly, we can show that $\inf(-x_n) = \sup(x_n)$. □

Theorem 1.2. $\inf_{k \geq m} x_k \leq \sup_{k \geq n} x_k, \forall m, n$.

Proof. We have

$$\inf_{k \geq n} x_k \leq x_n \leq \sup_{k \geq n} x_k.$$

Assume $m \leq n$, we have

$$\inf_{k \geq m} x_k \leq \inf_{k \geq n} x_k \leq x_n \leq \sup_{k \geq n} x_k.$$

Assume $m \geq n$, we have

$$\inf_{k \geq m} x_k \leq x_n \leq \sup_{k \geq m} x_k \leq \sup_{k \geq n} x_k.$$

Wherefore, $\inf_{k \geq m} x_k \leq \sup_{k \geq n} x_k, \forall m, n$. □

Definition 1.1 (Upper Limit). We define upper limit $\overline{\lim} x_n = \limsup_{n \rightarrow \infty} x_n$ as

$$\lim_{n \rightarrow \infty} \sup_{i \geq n} x_i = \inf_{n \geq 1} \sup_{i \geq n} x_i.$$

Definition 1.2 (Lower Limit). We define lower limit $\underline{\lim} x_n = \liminf_{n \rightarrow \infty} x_n$ as

$$\lim_{n \rightarrow \infty} \inf_{j \geq n} x_j = \sup_{n \geq 1} \inf_{j \geq n} x_j.$$

Theorem 1.3. $\underline{\lim} x_n \leq \overline{\lim} x_n$.

Proof. Since $\inf_{k \geq n} x_k \leq \sup_{k \geq n} x_k$,

$$\underline{\lim} x_n = \lim_{n \rightarrow \infty} \inf_{k \geq n} x_k \leq \lim_{n \rightarrow \infty} \sup_{k \geq n} x_k = \overline{\lim} x_n.$$

□

Theorem 1.4. $\sup_{k \geq n} x_k - \inf_{k \geq n} x_k = \sup_{i, j \geq n} |x_i - x_j|$.

Proof. We have

$$\sup_{i \geq n} x_i - x_j = \sup_{i \geq n} (x_i - x_j),$$

for any fixed j .

Wherefore

$$\begin{aligned} \sup_{i \geq n} x_i - \inf_{j \geq n} x_j &= \sup_{i \geq n} x_i + \sup_{j \geq n} (-x_j) = \sup_{j \geq n} \sup_{i \geq n} (x_i - x_j) \\ &= \sup_{j \geq n} \sup_{i \geq n} |x_i - x_j| = \sup_{i, j \geq n} |x_i - x_j|. \end{aligned}$$

□

Definition 1.3 (Cauchy). x_n is Cauchy iff

$$\sup_{i, j \geq n} |x_i - x_j| \rightarrow 0,$$

as $n \rightarrow \infty$.

Theorem 1.5. If a sequence converges, it must be Cauchy.

Proof. Suppose $\lim_{n \rightarrow \infty} x_n = x$, then

$$\forall \varepsilon > 0, \exists N \text{ s.t. } n \geq N \Rightarrow |x_n - x| < \frac{\varepsilon}{2}.$$

Therefore, $\forall i, j \geq N$, we have

$$|x_i - x_j| = |x_i - x + (x_j - x)| \leq |x_i - x| + |x_j - x| < \varepsilon,$$

i.e., the sequence is Cauchy.

□

Theorem 1.6. $x = \overline{\lim} x_n = \underline{\lim} x_n \Leftrightarrow x_n \rightarrow x$.

Proof. (\Rightarrow) We have $\inf_{k \geq n} x_k \leq x_n \leq \sup_{k \geq n} x_k$.

Since $x = \overline{\lim} x_n = \underline{\lim} x_n$, then

$$\inf_{k \geq n} x_k \leq \lim_{n \rightarrow \infty} \inf_{k \geq n} x_k = x = \lim_{n \rightarrow \infty} \sup_{k \geq n} x_k \leq \sup_{k \geq n} x_k.$$

As a consequence,

$$|x_n - x| \leq \sup_{k \geq n} x_k - \inf_{k \geq n} x_k \rightarrow 0, \text{ as } n \rightarrow \infty,$$

i.e., $x_n \rightarrow x$.

(\Leftarrow) Since $x_n \rightarrow x$, then the sequence is Cauchy, i.e.,

$$\sup_{i, j \geq n} |x_i - x_j| = \sup_{k \geq n} x_k - \inf_{k \geq n} x_k \rightarrow 0 \text{ as } n \rightarrow \infty.$$

Therefore, $\overline{\lim} x_n = \underline{\lim} x_n = x$.

□

1.2 Set

Definition 1.4 (Power Set). For a given set Ω , the power set is the set of all of its subsets

$$\mathcal{P}(\Omega) = \{A | A \subset \Omega\}.$$

The power set is closed w.r.t. all the usual set-theoretic operations.

Definition 1.5 (Symmetric Difference). For any two sets A and B ,

$$A \Delta B = (A - B) + (B - A) = A \cup B - AB.$$

Definition 1.6 (Arbitrary Unions). Let $\omega \in \Omega$, $A_n \subset \Omega$, $n \in \mathbb{N}$.

$$\omega \in \bigcup_{n \geq 1} A_n \text{ iff } \exists n \text{ s.t. } \omega \in A_n$$

Definition 1.7 (Arbitrary Intersections). Let $\omega \in \Omega$, $A_n \subset \Omega$, $n \in \mathbb{N}$.

$$\omega \in \bigcap_{n \geq 1} A_n \text{ iff } \forall n, \omega \in A_n.$$

Hence, we have

$$P(\omega \in A_n, \exists n) = P\left(\omega \in \bigcup_{n \geq 1} A_n\right) \text{ and } P(\omega \in A_n, \forall n) = P\left(\omega \in \bigcap_{n \geq 1} A_n\right).$$

Definition 1.8 (Infinitely Often). Let $\omega \in \Omega$, $A_n \subset \Omega$, $n, N \in \mathbb{N}$.

$$\omega \in \bigcap_{N \geq 1} \bigcup_{n \geq N} A_n \text{ iff } \forall N, \exists n \geq N \text{ s.t. } \omega \in \bigcup_{n \geq N} A_n.$$

Property 1.1. For any monotone sequence of sets, there will always exist a limit set, i.e.,

$$A_n \uparrow A = \bigcup_{n \geq 1} A_n, \text{ or } A_n \downarrow A = \bigcap_{n \geq 1} A_n.$$

Proof. Suppose A_n is increasing, then $\bigcap_{k \geq n} A_k = A_n$ and thus

$$\underline{\lim} A_n = \bigcup_{n \geq 1} \bigcap_{k \geq n} A_k = \bigcup_{n \geq 1} A_n.$$

Besides, $\bigcup_{k \geq n} A_k = \bigcup_n A_n$ and thus

$$\overline{\lim} A_n = \bigcap_{n \geq 1} \bigcup_{k \geq n} A_k = \bigcap_{n \geq 1} \bigcup_n A_n = \bigcup_{n \geq 1} A_n.$$

Wherefore, $\underline{\lim} A_n = \overline{\lim} A_n = \bigcup_{n \geq 1} A_n = A \Rightarrow A_n \uparrow A$.

Similarly, we can show that if $A_n \downarrow \bigcap_{n \geq 1} A_n$. □

1.3 Number System and Euclidean Space

With the notation of set, we can consider whole number as: $0 = \emptyset, 1 = \{\emptyset\}, 2 = \{0, 1\}, \dots$. Therefore

$$\begin{aligned} n + 1 &= n \cup \{n\} \\ &= \{0, 1, \dots, n-1\} \cup \{n\} \\ &= \{0, 1, \dots, n\}. \end{aligned}$$

We can also define number systems with set:

$$\begin{aligned} \mathbb{N} &= \{1, 2, \dots\}, \mathbb{W} = \mathbb{N} \cup \{0\}, \mathbb{Z} = \{0, \pm 1, \pm 2, \dots\}, \mathbb{Q} = \left\{ \frac{n}{m} \middle| n \in \mathbb{Z}, m \in \mathbb{N} \right\}, \\ \mathbb{R} &= \left\{ x = \lim_{n \rightarrow \infty} r_n \middle| r_n \in \mathbb{Q}, n \in \mathbb{N} \right\}, \mathbb{C} = \{z = x + iy \mid x, y \in \mathbb{R}\}. \end{aligned}$$

In multi-variable calculus, we define

$$\mathbb{R}^n = \{\mathbf{x} \mid x_i \in \mathbb{R}, i = 1, \dots, n\},$$

where $\mathbf{x} = (x_i, i = 1, \dots, n)$ and

$$\mathbb{R}^\infty = \{\mathbf{x} = (x_i, i = 1, 2, \dots) \mid x_i \in \mathbb{R}, i \in \mathbb{N}\}.$$

1.4 Function

Before we define a function, we look at the product $A \times B$ of any two sets A and B , which is defined as the set of all ordered pairs that may be formed of the elements of the first set A , with the second set B :

$$A \times B = \{(a, b) \mid a \in A, b \in B\}.$$

Definition 1.9 (Ordered Pairs). An ordered pair is $(a, b) = \{\{a\}, \{a, b\}\}$.

Definition 1.10 (Function). A function f with domain A and range B , denoted by $f : A \rightarrow B$, is any $f \subset A \times B$ s.t. $\forall a \in A, \exists! b \in B$ with $(a, b) \in f$.

From the definition, b is uniquely determined by a and we may write $b = f(a)$.

The collection of all functions from a particular domain A to a certain B is denoted by

$$B^A = \{f \subset A \times B \mid f : A \rightarrow B\}.$$

Definition 1.11 (Inverse Image). For any function say $X : \Omega \rightarrow \mathcal{X}$, the inverse image of any $A \subset \mathcal{X}$ is defined as

$$X^{-1}(A) := \{\omega \in \Omega \mid X(\omega) \in A\}.$$

Definition 1.12. $f = g$ iff $f(x) = g(x), \forall x$.

1.4.1 Indicator Function and Indicator Map

Definition 1.13 (Indicator Function). For any $A \subset \Omega$, we define $I_A \in 2^\Omega$ by

$$I_A(\omega) := \begin{cases} 1, & \omega \in A \\ 0, & \omega \notin A \end{cases}.$$

Indicator function defines a bijective correspondence between subsets of Ω and their indicator functions, that is referred to as the indicator map

$$\begin{aligned} I : \mathcal{P}(\Omega) &\xrightarrow{\cong} 2^\Omega \\ A &\mapsto I_A. \end{aligned}$$

Theorem 1.7. The indicator map is bijective.

Proof. We want to show the indicator map is both injective and surjective.

(Injection) Let $I_A = I_B$, then $I_A(\omega) = I_B(\omega), \forall \omega$.

We have

$$\omega \in A \Leftrightarrow I_A(\omega) = 1 = I_B(\omega) \Leftrightarrow \omega \in B,$$

i.e., $A = B$.

(Surjection) Want to show $\forall f \in 2^\Omega, \exists A \in \mathcal{P}(\Omega)$ s.t. $I(A) = I_A = f$.

Take any $f \in 2^\Omega$ and let $A = \{\omega | f(\omega) = 1\}$. We have

$$\omega \in A \Leftrightarrow \begin{cases} f(\omega) = 1 \\ I_A(\omega) = 1 \end{cases} \Rightarrow f(\omega) = I_A(\omega), \forall \omega.$$

Hence, $f = I_A$. □

From the proof, we also have

$$A = f^{-1}(1) = I_A^{-1}(1).$$

Definition 1.14 (Convergence of Set). $A_n \rightarrow A$ iff $I(A_n) \rightarrow I(A)$.

By the theorem, we have

$$\begin{aligned} A_n \rightarrow A &\Leftrightarrow \overline{\lim} I(A_n) = \underline{\lim} I(A_n) = I(A) \\ &\Leftrightarrow \inf_{n \geq 1} \sup_{k \geq n} I(A_k) = \sup_{n \geq 1} \inf_{k \geq n} I(A_k) = I(A) \\ &\Leftrightarrow I\left(\bigcap_{n \geq 1} \bigcup_{k \geq n} A_k\right) = I\left(\bigcup_{n \geq 1} \bigcap_{k \geq n} A_k\right) = I(A) \\ &\Leftrightarrow \bigcap_{n \geq 1} \bigcup_{k \geq n} A_k = \bigcup_{n \geq 1} \bigcap_{k \geq n} A_k = A. \end{aligned}$$

Note that

$$I_{\bigcap_{n \geq 1} A_n}(\omega) = \inf_{n \geq 1} I_{A_n}(\omega) \text{ and } I_{\bigcup_{n \geq 1} A_n}(\omega) = \sup_{n \geq 1} I_{A_n}(\omega).$$

Also,

$$\sum_{n=1}^{\infty} I_{A_n}(\omega) \in \mathbb{W} \cup \{\infty\}.$$

Example 1.1. If $A_n \rightarrow A, B_n \rightarrow B, C_n \rightarrow C$, then $A_n(B_n - C_n) \rightarrow A(B - C)$.

Proof. Since $A_n \rightarrow A, B_n \rightarrow B, C_n \rightarrow C$, then $I(A_n) \rightarrow I(A), I(B_n) \rightarrow I(B), I(C_n) \rightarrow I(C)$. Besides,

$$I_{A_n(B_n - C_n)} = I_{A_n(B_n - B_n C_n)} = I_{A_n B_n} - I_{A_n B_n C_n} = I_{A_n} I_{B_n} - I_{A_n} I_{B_n} I_{C_n} \rightarrow I_A I_B - I_A I_B I_C = I_{A(B-C)}.$$

Therefore, $A_n(B_n - C_n) \rightarrow A(B - C)$. \square

Example 1.2. If $A_n \rightarrow A, B_n \rightarrow B$, then $A_n \Delta B_n \rightarrow A \Delta B$.

Proof. Since $A_n \rightarrow A, B_n \rightarrow B$, then $I(A_n) \rightarrow I(A), I(B_n) \rightarrow I(B)$. Besides,

$$I_{A_n \Delta B_n} = I_{A_n \cup B_n - A_n B_n} = I_{A_n + B_n - 2A_n B_n} = I_{A_n} + I_{B_n} - 2I_{A_n} I_{B_n} \rightarrow I_A + I_B - 2I_A I_B = I_{A \Delta B}.$$

Therefore, $A_n \Delta B_n \rightarrow A \Delta B$. \square

1.5 Linear Algebra

Definition 1.15 (Dot Product). We define

$$\mathbf{x}^T \cdot \mathbf{y} = (x_1, \dots, x_n) \begin{pmatrix} y_1 \\ \vdots \\ y_n \end{pmatrix} = \sum_{i=1}^n x_i y_i.$$

Definition 1.16 (Vector Norm). $\|\mathbf{x}\| = \sqrt{\mathbf{x}^T \mathbf{x}}$.

2 Probability Space

Definition 2.1 (σ -algebra). Let Ω be a set, then $\mathcal{F} \subseteq \mathcal{P}(\Omega)$ is called a σ -algebra s.t.

- (1) $\mathcal{F} \neq \emptyset$;
- (2) if $A \in \mathcal{F}$, then $A^C \in \mathcal{F}$, i.e., \mathcal{F} is closed under complements;
- (3) if $A_i \in \mathcal{F}, i \in \mathbb{N}$, then $\bigcup_{i=1}^{\infty} A_i \in \mathcal{F}$, i.e., \mathcal{F} is closed under countable unions.

Note. From the second and third condition above we know that $\bigcap_{i=1}^{\infty} A_i \in \mathcal{F}$ since $\bigcap_{i=1}^{\infty} A_i = \left(\bigcup_{n=1}^{\infty} A_i^C \right)^C$. We can also show that $\Omega, \emptyset \in \mathcal{F}$.

Definition 2.2 (Probability Measure). The probability measure $P : \mathcal{F} \rightarrow [0, 1]$ is a function s.t.

- (1) σ -additivity: $P\left(\sum_{n=1}^{\infty} A_n\right) = \sum_{n=1}^{\infty} P(A_n)$ provided $A_i A_j = \emptyset, \forall i \neq j$;
- (2) non-negativity: $P(A) \geq 0, \forall A \in \mathcal{F}$;
- (3) normalization: $P(\Omega) = 1$.

Definition 2.3 (Probability Space). A probability space is a mathematical triplet (Ω, \mathcal{F}, P) , where the sample space Ω is the set of all possible outcomes, the σ -algebra \mathcal{F} is a collection of all the events, and the probability measure P is a function returning an event's probability.

Property 2.1. If $A_n \uparrow A$ or $A_n \downarrow A$, then $P(A_n) \rightarrow P(A)$.

Proof. If $A_n \uparrow A$, we have

$$A = \bigcup_{n \geq 1} A_n = \bigcup_{n \geq 1} (A_n - A_{n-1}),$$

where $A_0 = \emptyset$. Let $B_n = A_n - A_{n-1}$ and we have B_n 's are disjoint for all n . Hence,

$$\begin{aligned} P(A) &= P\left(\bigcup_{n \geq 1} (A_n - A_{n-1})\right) = \sum_{n=1}^{\infty} P(A_n - A_{n-1}) = \lim_{j \rightarrow \infty} \sum_{n=1}^j P(A_n - A_{n-1}) \\ &= \lim_{j \rightarrow \infty} P\left(\bigcup_{n=1}^j (A_n - A_{n-1})\right) = \lim_{j \rightarrow \infty} P(A_j) = \lim_{n \rightarrow \infty} P(A_n), \end{aligned}$$

i.e., $P(A_n) \rightarrow P(A)$.

If $A_n \downarrow A$, then $A_n^C \uparrow A^C$, and $P(A_n^C) \rightarrow P(A^C) \Leftrightarrow P(A_n) \rightarrow P(A)$. □

Corollary 1 (Sequential Continuity). $A_n \rightarrow A \Rightarrow P(A_n) \rightarrow P(A)$.

Proof. Since $A_n \rightarrow A$, □

3 Expectation, Variance and Covariance

Definition 3.1 (Expect Value). We define expect value as

$$\mathbb{E}[X] = \lim_{n \rightarrow \infty} \frac{x_1 + \cdots + x_n}{n}.$$

Example 3.1. $\langle X, Y \rangle = \mathbb{E}[XY] = \lim_{n \rightarrow \infty} \frac{\sum_{i=1}^n x_i y_i}{n} = \lim_{n \rightarrow \infty} \frac{\mathbf{x}^T \mathbf{y}}{n}.$

Example 3.2. $|X| = \sqrt{\mathbb{E}[X^2]} = \lim_{n \rightarrow \infty} \frac{\sqrt{\sum_{i=1}^n x_i^2}}{\sqrt{n}} = \lim_{n \rightarrow \infty} \frac{\|\mathbf{x}\|}{\sqrt{n}}.$

Example 3.3. Let $\angle(\mathbf{x}, \mathbf{y})$ be the angle between \mathbf{x} and \mathbf{y} . Then

$$\cos \angle(\mathbf{x}, \mathbf{y}) = \frac{\mathbf{x}^T \mathbf{y}}{\|\mathbf{x}\| \|\mathbf{y}\|} = \frac{\mathbf{x}^T \mathbf{y} / n}{(\|\mathbf{x}\| / \sqrt{n})(\|\mathbf{y}\| / \sqrt{n})} \rightarrow \frac{\mathbb{E}[XY]}{\sqrt{\mathbb{E}[X^2]} \sqrt{\mathbb{E}[Y^2]}}.$$

Example 3.4. We have

$$\begin{aligned} r &= \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^n (x_i - \bar{x})^2} \sqrt{\sum_{i=1}^n (y_i - \bar{y})^2}} \\ &\rightarrow \frac{\mathbb{E}[\dot{X}\dot{Y}]}{\sqrt{\mathbb{E}[\dot{X}^2]} \sqrt{\mathbb{E}[\dot{Y}^2]}} = \frac{\mathbb{E}[(X - \mathbb{E}[X])(Y - \mathbb{E}[Y])]}{|X - \mathbb{E}[X]| |Y - \mathbb{E}[Y]|} = \cos \angle(\dot{X}, \dot{Y}). \end{aligned}$$

Definition 3.2. $\cos \angle(X, Y) \stackrel{\text{def'n}}{=} \frac{\mathbb{E}[XY]}{|X||Y|} \stackrel{\text{LLN}}{=} \frac{\mathbf{x}^T \mathbf{y}}{\|\mathbf{x}\| \|\mathbf{y}\|} = \cos \angle(\mathbf{x}, \mathbf{y}).$

Property 3.1. $\mathbb{E}[X]$ is closest constant to X , i.e.,

$$|X - \mathbb{E}[X]| = \inf_{t \in \mathbb{R}} |X - t|.$$

Proof. Hint: $f(t) = \sqrt{\mathbb{E}[(X - t)^2]}, g(t) = \mathbb{E}[(X - t)^2].$ □

Definition 3.3 (Covariance). Define

$$\text{Cov}(X, Y) = \mathbb{E}[\dot{X}\dot{Y}] = \mathbb{E}[(X - \mathbb{E}[X])(Y - \mathbb{E}[Y])].$$

Property 3.2. Here are some properties of covariance.

(1) Bilinear: $\text{Cov}\left[\sum_{i=1}^m a_i X_i, \sum_{j=1}^n b_j Y_j\right] = \sum_{i=1}^m \sum_{j=1}^n a_i b_j \text{Cov}(X_i, Y_j);$

(2) Symmetric: $\text{Cov}(X, Y) = \text{Cov}(Y, X);$

(3) Non-negative: $\text{Cov}(X, X) = \mathbb{E}[\dot{X}\dot{X}] = \mathbb{E}[(X - \mathbb{E}[X])^2] = \text{Var}[X] \geq 0$ with equality iff $X = \mathbb{E}[X]$, with probability 1.

Definition 3.4. Define

$$\rho(X, Y) = \cos \angle (\dot{X}, \dot{Y}) = \frac{\mathbb{E}[(X - \mathbb{E}[X])(Y - \mathbb{E}[Y])]}{\sqrt{\text{Var}[X]}\sqrt{\text{Var}[Y]}} = \frac{\text{Cov}(X, Y)}{\sigma(X)\sigma(Y)},$$

where $\sigma(X) = \sqrt{\text{Var}[X]} = \left| \dot{X} \right| = |X - \mathbb{E}[X]|$.

Theorem 3.1 (Markov Inequality). Given $Z \geq 0, t \geq 0$, for any $g : [0, \infty) \rightarrow [0, \infty)$ be increasing, we have

$$P(Z \geq t) \leq \frac{\mathbb{E}[g(Z)]}{g(t)}.$$

Proof. We have $g(Z) \geq g(t)I(Z \geq t) \Rightarrow \mathbb{E}[g(Z)] \geq g(t)\mathbb{E}[I(Z \geq t)] = g(t)P(Z \geq t)$, and thus $P(Z \geq t) \leq \frac{\mathbb{E}[g(Z)]}{g(t)}$. \square

Corollary 2 (Chebyshev Inequality). We have

$$P(|X - \mathbb{E}[X]| \geq k) \leq \frac{\mathbb{E}[(X - \mathbb{E}[X])^2]}{k^2}$$

or

$$P(|X - \mathbb{E}[X]| \geq k\sigma) \leq \frac{1}{k^2}.$$

Property 3.3. $\text{Var}[X] = 0 \Leftrightarrow X = \mathbb{E}[X]$, with probability 1.

Proof. (\Rightarrow) Suppose $\text{Var}[X] = 0$, then

$$P\left(|X - \mathbb{E}[X]| \geq \frac{1}{n}\right) \leq n^2 \times 0 = 0,$$

i.e., $P(|X - \mathbb{E}[X]| \geq \frac{1}{n}) = 0$ for all $n \Rightarrow P(|X - \mathbb{E}[X]| < \frac{1}{n}) = 1$ for all n .

Let $A_n = (|X - \mathbb{E}[X]| < \frac{1}{n})$. As $n \rightarrow \infty$, A_n is decreasing and $A_n \rightarrow A = (|X - \mathbb{E}[X]| = 0)$.

Thus, $P(A_n) \rightarrow P(A) = P(|X - \mathbb{E}[X]| = 0) = 1 \Rightarrow P(X = \mathbb{E}[X]) = 1$.

(\Leftarrow) Suppose $P(X = \mathbb{E}[X]) = 1$, then $P(|X - \mathbb{E}[X]|^2 = 0) := P(Y = 0) = 1$.

Therefore, $\text{Var}[X] = \mathbb{E}[Y] = 0 \times 1 = 0$. \square

Definition 3.5 (Equality in Distribution). $X \stackrel{d}{=} Y$ on sample space \mathcal{X} iff

$$\mathbb{E}[g(X)] = \mathbb{E}[g(Y)], \forall g : \mathcal{X} \rightarrow \mathbb{R}.$$

Example 3.5. If $X \stackrel{d}{=} Y$, then let $g = I_A, A \subset \mathcal{X}$, then

$$P(x \in A) = \mathbb{E}[I_A(X)] = \mathbb{E}[I_A(Y)] = P(Y \in A).$$

Theorem 3.2. If $X \stackrel{d}{=} Y$, then $\phi(X) \stackrel{d}{=} \phi(Y), \forall \phi : \mathcal{X} \rightarrow \mathcal{Y}$.

Proof. Since $X \stackrel{d}{=} Y$, then $\mathbb{E}[g(X)] = \mathbb{E}[g(Y)], \forall g : \mathcal{X} \rightarrow \mathbb{R}$.

Let $g = h\phi, \forall h : \mathcal{Y} \rightarrow \mathbb{R}$, then we have

$$\mathbb{E}[h\phi(X)] = \mathbb{E}[h\phi(Y)], \forall h : \mathcal{Y} \rightarrow \mathbb{R},$$

i.e., $\phi(X) \stackrel{d}{=} \phi(Y), \forall \phi : \mathcal{X} \rightarrow \mathcal{Y}$. \square

Note that $\mathbb{E} : \mathcal{R} \rightarrow \mathbb{R}^* \cup \{*\}$ defined on $\mathcal{R} = \{X : \text{Real valued random variable}\}$.

4 Probability Distribution

4.1 General Finite Discrete Distribution

Definition 4.1 (Finite Scheme). A finite scheme is a name for any finite discrete distribution where

$$X \sim \begin{pmatrix} a_1, \dots, a_N \\ p_1, \dots, p_N \end{pmatrix},$$

$$\text{i.e., } X = \sum_{j=1}^N a_j I_{\{a_j\}}(X).$$

By the definition, we have

$$\mathbb{E}[X] = \sum_{j=1}^N a_j \mathbb{E}[I_{\{a_j\}}(X)] = \sum_{j=1}^N a_j P(X = a_j) = \sum_{j=1}^N a_j p_j.$$

Definition 4.2 (Cumulative Distribution Function). We define

$$F(x) = P(X \leq x) = P(X \in (-\infty, x]) = P_X((-\infty, x]).$$

Example 4.1. $F(x + n^{-1}) = P_X((-\infty, x + n^{-1}])$. As $n \rightarrow \infty$,

$$F(x + n^{-1}) \rightarrow P_X((-\infty, x]) = F(x).$$

Example 4.2. $F(x - n^{-1}) = P_X((-\infty, x - n^{-1}])$. As $n \rightarrow \infty$,

$$F(x - n^{-1}) \rightarrow P_X((-\infty, x)) = P(X < x).$$

Definition 4.3. $F(x+) := \lim_{n \rightarrow \infty} F(x + n^{-1}) = F(x)$, i.e., any distribution function is right continuous at every point x .

Definition 4.4. $F(x-) := \lim_{n \rightarrow \infty} F(x - n^{-1}) = P(X < x)$.

Definition 4.5 (Probability Mass Function). A probability mass function of X is $p : \mathbb{R} \rightarrow [0, 1]$ given by

$$p(x) = P(X = x) = P_X(\{x\}) = P(X \in \{x\}).$$

Property 4.1. $p(x) = F(x) - F(x-)$.

Proof. We have $p(x) = P(X \leq x) - P(X < x) = F(x) - F(x-)$. □

Property 4.2. $|\{x \in \mathbb{R} | p(x) > 0\}| \leq |\mathbb{N}|$.

Proof. Note that $\{x \in \mathbb{R} | p(x) > 0\} = \bigcup_{n=1}^{\infty} \{x \in \mathbb{R} | p(x) > \frac{1}{n}\}$. Actually,

$$\forall n \in \mathbb{N}, |\{x \in \mathbb{R} | p(x) > \frac{1}{n}\}| < n.$$

Otherwise, $\exists A_n = \{a_1, \dots, a_n\} \subset \{x \in \mathbb{R} | p(x) > \frac{1}{n}\}$ s.t. $P(A_n) > \frac{n}{n} = 1$. □

Property 4.3. F is continuous at $x \Leftrightarrow p(x) = 0$.

Proof. F is continuous at $x \Leftrightarrow F(x-) = F(x+) \Leftrightarrow F(x-) = F(x) \Leftrightarrow F(x) - F(x-) = p(x) = 0$. □

4.2 Lebesgue-Stieltjes Integral

Consider any \mathbb{R} -valued $X \geq 0$ and let

$$X_n = \sum_{j=1}^n \frac{j-1}{\sqrt{n}} I_{\left(\frac{j-1}{\sqrt{n}}, \frac{j}{\sqrt{n}}\right]}(X).$$

Then we have $0 \leq X_n \leq X$, and thus

$$\begin{aligned} 0 \leq X - X_n &= \sum_{j=1}^n \left(X - \frac{j-1}{\sqrt{n}} \right) I_{\left(\frac{j-1}{\sqrt{n}}, \frac{j}{\sqrt{n}}\right]}(X) + X I_{(\sqrt{n}, \infty)}(X) \\ &\leq \sum_{j=1}^n \frac{1}{\sqrt{n}} I_{\left(\frac{j-1}{\sqrt{n}}, \frac{j}{\sqrt{n}}\right]}(X) + X I_{(\sqrt{n}, \infty)}(X) \\ &= \frac{1}{\sqrt{n}} I_{(0, \sqrt{n}]}(X) + X I_{(\sqrt{n}, \infty)}(X) \\ &\leq \frac{1}{\sqrt{n}} + X I_{(\sqrt{n}, \infty)}(X) \rightarrow 0 \end{aligned}$$

as $n \rightarrow \infty$, i.e., $X_n \rightarrow X$ as $n \rightarrow \infty$.

Let $h : [0, \infty) \rightarrow [0, \infty)$ be continuous and we have $h(X_n) \rightarrow h(X) \Rightarrow \mathbb{E}[h(X_n)] \rightarrow \mathbb{E}[h(X)]$, i.e.,

$$\begin{aligned} \mathbb{E}[h(X)] &= \lim_{n \rightarrow \infty} \sum_{j=1}^n h\left(\frac{j-1}{\sqrt{n}}\right) P\left(\frac{j-1}{\sqrt{n}} < X \leq \frac{j}{\sqrt{n}}\right) \\ &= \lim_{n \rightarrow \infty} \sum_{j=1}^n h\left(\frac{j-1}{\sqrt{n}}\right) \left[F\left(\frac{j}{\sqrt{n}}\right) - F\left(\frac{j-1}{\sqrt{n}}\right) \right] \\ &:= \int_0^\infty h(x) dF(x), \end{aligned}$$

which is called the Lebesgue-Stieltjes integral.

4.3 Uniform Distribution

Definition 4.6 (Finite Discrete Uniform Distribution). $U \sim \text{unif}(\Omega)$ with $|\Omega| < |\mathbb{N}|$ iff

$$P(U = \omega) = \frac{1}{|\Omega|} \Leftrightarrow P(U \in A) = \frac{|A|}{|\Omega|}.$$

Example 4.3. $U \sim \text{unif}\{1, \dots, n\}$ iff $P(U = i) = \frac{1}{n}, i = 1, \dots, n$.

Example 4.4. Let $U \sim \text{unif}\{1, \dots, n\}$, then $-U \sim \text{unif}\{-n, \dots, -1\}$ and $n+1-U \sim \text{unif}\{1, \dots, n\}$. Hence we say $n+1-U \stackrel{d}{=} U$ and thus

$$n+1 - \mathbb{E}[U] = \mathbb{E}[U] \Rightarrow \mathbb{E}[U] = \frac{n+1}{2} = \frac{1 + \dots + n}{n}.$$

Example 4.5. Let $U \sim \text{unif}\{1, \dots, n\}$, then $U^k \sim \text{unif}\{1^k, \dots, n^k\}$, and thus we have

$$\mathbb{E}[U^k] = \frac{1^k + 2^k + \dots + n^k}{n} \text{ and } \mathbb{E}[(U-1)^k] = \frac{0^k + 1^k + \dots + (n-1)^k}{n},$$

and thus

$$\mathbb{E}[U^k] - \mathbb{E}[(U-1)^k] = n^{k-1}.$$

Recall that

$$(a+b)^n = \sum_{k=0}^n \binom{n}{k} a^k b^{n-k}.$$

Therefore,

$$\mathbb{E}[U^3] - \mathbb{E}[(U-1)^3] = n^2 = \mathbb{E}[U^3] - (\mathbb{E}[U^3] - 3\mathbb{E}[U^2] + 3\mathbb{E}[U] - 1),$$

i.e.,

$$3\mathbb{E}[U^2] = n^2 + 3\mathbb{E}[U] - 1 = n^2 + \frac{3(n+1)}{2} - 1 = \frac{(n+1)(2n+1)}{2}.$$

Thus,

$$\mathbb{E}[U^2] = \frac{(n+1)(2n+1)}{6} = \frac{1^2 + 2^2 + \cdots + n^2}{n}.$$

Example 4.6. Let $U \sim \text{unif}\{1, \dots, n\}$, then

$$\text{Var}[U] = \mathbb{E}[U^2] - (\mathbb{E}[U])^2 = \frac{(n+1)(2n+1)}{6} - \frac{(n+1)^2}{4} = \frac{n^2-1}{12}.$$

Definition 4.7 (Standard Uniform). $Z \sim \text{unif}(p)$, where $p = \{0, 1, \dots, p-1\}$, iff

$$P(Z = i) = \frac{1}{p}, \forall i \in p.$$

$U \sim \text{unif}[0, 1]$ iff

$$P(U \leq u) = u, \forall 0 \leq u \leq 1.$$

Example 4.7. $U \sim \text{unif}[0, 1] \Leftrightarrow [nU] \sim \text{unif}\{0, \dots, n-1\}, \forall n$.

Proof. (\Rightarrow) $P([nU] = k) = P(k \leq nU < k+1) = P(\frac{k}{n} \leq U < \frac{k+1}{n}) = \frac{1}{n}$. We also need $\frac{k}{n} \geq 0$ and $\frac{k+1}{n} \leq 1$ and thus $k = 0, \dots, n-1$, i.e., $[nU] \sim \text{unif}\{0, \dots, n-1\}, \forall n$.

(\Leftarrow) Consider $P(U < r), \forall r \in \mathbb{Q}[0, 1]$. Suppose $r = \frac{k}{n}, k < n$, we have

$$\begin{aligned} P(U < r) &= P(nU < k) = \sum_{i=0}^{n-1} P(nU < k, [nU] = i) = \sum_{i=1}^{n-1} P(0 \leq nU < k, i \leq nU < i+1) \\ &= \sum_{i=0}^{k-1} P(i \leq nU < i+1) = \sum_{i=0}^{k-1} P([nU] = i) = \frac{k}{n} = r. \end{aligned}$$

Besides, $\forall 0 \leq u < 1, \exists \{r_n\} \in \mathbb{Q}[0, 1)$ s.t. $r_n \downarrow u$ and thus $[0, r_n) \rightarrow [0, u]$ and

$$P(U \leq u) = \lim_{n \rightarrow \infty} P(U < r_n) = \lim_{n \rightarrow \infty} r_n = u.$$

□

4.3.1 Fundamental Theorem of Applied Probability

Definition 4.8 (p -Adic Series). For any $p \in \mathbb{N}$ with $p \geq 2$ we define the p -adic series

$$U = \sum_{i=1}^{\infty} Z_i p^{-i}.$$

Example 4.8. $Z : z_{11}, z_{12}, \dots, z_{1n}, \dots; z_{21}, z_{22}, \dots, z_{2n}$ and
 $U = .z_{11}z_{12}z_{13} \dots, .z_{21}z_{22}z_{23} \dots$.

If $Z \sim \text{unif}(10)$, then $.z_1z_2 \dots z_n \dots = \sum_{i=1}^{\infty} z_i 10^{-i}$.

Lemma 4.1. Let $\dot{p}^{\infty} = \{\mathbf{z} = (z_i, i \in \mathbb{N}) \mid z_i \in p, i \in \mathbb{N}, z_i < p - 1 \text{ io}(i)\}$. Then $u = \sum_{i=1}^{\infty} z_i p^{-i}$ defines a bijective function $\Phi : \dot{p}^{\infty} \xrightarrow{\cong} [0, 1)$.

Note. The range cannot include 1, because it is not allowed to end in $p - 1$ repeated and

$$\sum_{i=1}^{\infty} p^{-i}(p - 1) = \frac{p - 1}{p} \sum_{i=0}^{\infty} p^{-i} = \frac{p - 1}{p} = 1.$$

Proof. We know $0 \leq u < \frac{p-1}{p} \sum_{i=0}^{\infty} p^{-i} = 1$.

Besides,

$$\begin{aligned} u &= \sum_{i=1}^{\infty} z_i p^{-i} \\ \Leftrightarrow 0 &\leq u - \sum_{i=1}^n z_i p^{-i} = \sum_{i=n+1}^{\infty} z_i p^{-i} < \sum_{i=n+1}^{\infty} p^{-i}(p - 1) = p^{-(n+1)} \frac{p - 1}{1 - 1/p} = p^{-n}. \\ \Leftrightarrow z_n p^{-n} &\leq u - \sum_{i=1}^{n-1} z_i p^{-i} < p^{-n} + z_n p^{-n} = (z_n + 1)p^{-n}. \\ \Leftrightarrow z_n &\leq p^n \left(u - \sum_{i=1}^{n-1} z_i p^{-i} \right) < z_n + 1. \end{aligned}$$

Recall that $[x] = m$ iff $m \leq x < m + 1$ uniquely determines m as the greatest integer less than or equal to x . Therefore,

$$z_n = \left[p^n \left(u - \sum_{i=1}^{n-1} z_i p^{-i} \right) \right], n \geq 2,$$

and $z_1 \leq pu < z_1 + 1 \Rightarrow z_1 = [pu]$. □

Lemma 4.2. $\sum_{i=0}^n a_i p^i = 0$, where $|a_i| < p, \forall i \Leftrightarrow a_i = 0, \forall i$.

Proof. (\Rightarrow) Assume $\sum_{i=0}^n a_i p^i = 0$.

(1) When $n = 1 : |a_1|p = |a_0| < p \Rightarrow |a_1| < 1 \Rightarrow a_1 = 0 = a_0$.

(2) Suppose it holds for all n , then

$$\sum_{i=1}^{n+1} a_i p^i = \sum_{i=1}^n a_i p^i + a_{n+1} p^{n+1} = a_{n+1} p^{n+1} = 0 \text{ and } a_0 = \dots = a_n = 0.$$

Therefore,

$$|a_{n+1} p^{n+1}| = |a_n p^n| < p^{n+1} \Rightarrow |a_{n+1}| < 1 \Rightarrow a_{n+1} = 0.$$

Wherefore, by induction, it holds for all i .

(\Leftarrow) Suppose $a_i = 0, \forall i$, then $\sum_{i=1}^n a_i p^i = 0$, where $|a_i| < p, \forall i$. □

Lemma 4.3. For $u = \sum_{i=1}^{\infty} z_i p^{-i}, \mathbf{z} \in \dot{p}^{\infty}$, we have

$$z_1 = b_1, \dots, z_n = b_n \Leftrightarrow u \in \left[\sum_{i=1}^n b_i p^{-i}, \sum_{i=1}^n b_i p^{-i} + p^{-n} \right).$$

Proof. (\Leftarrow) We have

$$\begin{aligned} \sum_{i=1}^n b_i p^{-i} \leq u < \sum_{i=1}^n b_i p^{-i} + p^{-n} &\Rightarrow \sum_{i=1}^n b_i p^{-i} \leq \sum_{i=1}^n z_i p^{-i} + \sum_{i=n+1}^{\infty} z_i p^{-i} < \sum_{i=1}^n b_i p^{-i} + p^{-n} \\ &\Rightarrow 0 \leq \sum_{i=1}^n (z_i - b_i) p^{-i} + \sum_{i=n+1}^{\infty} z_i p^{-i} < p^{-n}. \end{aligned}$$

Besides,

$$0 \leq \sum_{i=n+1}^{\infty} z_i p^{-i} < (p-1) \sum_{i=n+1}^{\infty} p^{-i} = p^{-n},$$

then

$$-p^{-n} < -\sum_{i=n+1}^{\infty} z_i p^{-i} \leq 0.$$

Therefore,

$$-p^{-n} < \sum_{i=1}^n (z_i - b_i) p^{-i} < p^{-n} \Rightarrow \left| \sum_{i=1}^n (z_i - b_i) p^{-i} \right| < p^{-n} \Rightarrow \left| \sum_{i=1}^n (z_i - b_i) p^{n-i} \right| < 1,$$

where $|z_i - b_i| < p$. Since $\sum_{i=1}^n (z_i - b_i) p^{n-i} \in \mathbb{Z}$, then $\sum_{i=1}^n (z_i - b_i) p^{n-i} = 0$. By lemma, $z_i = b_i$.

(\Rightarrow) Suppose $z_i = b_i, \forall i$, then

$$0 \leq \sum_{i=1}^n (z_i - b_i) p^{-i} + \sum_{i=n+1}^{\infty} z_i p^{-i} < 0 + (p-1) \sum_{i=n+1}^{\infty} p^{-i} = p^{-n},$$

i.e.,

$$\sum_{i=1}^n b_i p^{-i} \leq \sum_{i=1}^{\infty} z_i p^{-i} < \sum_{i=1}^n b_i p^{-i} + p^{-n}.$$

□

Theorem 4.1 (Fundamental Theorem of Applied Probability). For $U = \sum_{i=1}^{\infty} Z_i p^{-i}, p \geq 2$, we have

$$U \sim \text{unif}[0, 1] \Leftrightarrow Z_i \stackrel{\text{i.i.d.}}{\sim} \text{unif}(p).$$

4.4 Bernoulli Distribution

Definition 4.9 (Bernoulli Distribution). $Z \sim \text{bern}(p), p \in [0, 1]$ iff

$$Z \sim \begin{pmatrix} 0 & 1 \\ q & p \end{pmatrix}.$$

Example 4.9. $Z^{-1} \sim \begin{pmatrix} \infty & 1 \\ q & p \end{pmatrix}.$

Example 4.10. $Z^s = Z, \forall s > 0.$

Property 4.4. $\mathbb{E}[Z] = p, \mathbb{E}[Z^2] = \mathbb{E}[Z] = p.$

Property 4.5. $\text{Var}[Z] = \mathbb{E}[Z^2] - (\mathbb{E}[Z])^2 = p - p^2 = pq, \sigma(Z) = \sqrt{pq}.$

4.5 Binomial Distribution

Definition 4.10 (Binomial Distribution). $X \sim \text{bin}(n, p), n \in \mathbb{N}, p \in [0, 1]$ iff

$$X \stackrel{d}{=} Z_1 + \cdots + Z_n,$$

where $Z_i \stackrel{\text{i.i.d.}}{\sim} Z \sim \text{bern}(p), i \in \mathbb{N}.$

Note that p is the probability per trial.

Property 4.6. $\mathbb{E}[X] = \sum_{i=1}^n \mathbb{E}[Z_i] = np.$

Property 4.7. $\text{Var}[X] = \sum_{i=1}^n \text{Var}[Z_i] = npq, \sigma(X) = \sqrt{n}\sqrt{pq}.$

Property 4.8. Let $X \sim \text{bin}(m, p), Y \sim \text{bin}(n, p), X \perp Y$, then $X + Y \sim \text{bin}(m + n, p).$

Proof. Take $Z_1, \dots, Z_{m+n} \stackrel{\text{i.i.d.}}{\sim} \text{bern}(p).$ Let

$$\begin{pmatrix} X \\ Y \end{pmatrix} \stackrel{d}{=} \begin{pmatrix} Z_1 + \cdots + Z_m \\ Z_{m+1} + \cdots + Z_{m+n} \end{pmatrix},$$

then we have $X + Y \stackrel{d}{=} \sum_{i=1}^{m+n} Z_i.$ □

Property 4.9. $P(X = k) = \binom{n}{k} p^k q^{n-k}.$

Proof. We have $P(X = k) = P(Z_1 + \cdots + Z_n = k)$ and $P(Z = z) = p^z q^{1-z}, z \in \{0, 1\}.$ Also,

$$\begin{aligned} P((Z_1, \dots, Z_n) = (z_1, \dots, z_n)) &= P(Z_1 = z_1, \dots, Z_n = z_n) \stackrel{\text{independent}}{=} P(Z_1 = z_1) \cdots P(Z_n = z_n) \\ &= p^{z_1} q^{1-z_1} \cdots p^{z_n} q^{1-z_n} = p^{\sum z_i} q^{n-\sum z_i}. \end{aligned}$$

Hence,

$$P(X = k) = \sum P((Z_1, \dots, Z_n) = (z_1, \dots, z_n)), (z_1, \dots, z_n) \in C_k^n,$$

where $C_k^n = \left\{ (z_1, \dots, z_n) \mid z_i \in \{0, 1\}, i = 1, \dots, n \text{ s.t. } \sum_{i=1}^n z_i = k \right\}.$

Thus,

$$P(X = k) = \sum_{(z_1, \dots, z_n) \in C_k^n} p^{\sum z_i} q^{n-\sum z_i} = \sum_{(z_1, \dots, z_n) \in C_k^n} p^k q^{n-k} = |C_k^n| p^k q^{n-k} := \binom{n}{k} p^k q^{n-k}.$$

□

Property 4.10. $\binom{n}{k} = \frac{n^{(k)}}{k!} = \frac{n!}{k!(n-k)!}$.

Proof. We have

$$\sum_{k=0}^n P(X = k) = 1 = \sum_{k=0}^n \binom{n}{k} p^k q^{n-k} = \sum_{k=0}^n \binom{n}{k} p^k (1-p)^{n-k}.$$

Let $p = \frac{t}{1+t}$, $q = \frac{1}{1+t}$, then

$$\begin{aligned} (1+t)^n &= \sum_{k=0}^n \binom{n}{k} t^k \\ \Rightarrow n(1+t)^{n-1} &= \sum_{k=0}^n k \binom{n}{k} t^{k-1} \\ \Rightarrow n \sum_{k=0}^{n-1} \binom{n-1}{k} t^k &= \sum_{k=0}^n k \binom{n}{k} t^{k-1} \end{aligned}$$

Let $j = k+1$, $k = j-1$, then

$$\sum_{j=1}^n n \binom{n-1}{j-1} t^{j-1} = \sum_{k=1}^n n \binom{n-1}{k-1} t^{k-1} = \sum_{k=1}^n k \binom{n}{k} t^{k-1}.$$

Wherefore

$$k \binom{n}{k} = n \binom{n-1}{k-1} \Rightarrow \binom{n}{k} = \frac{n}{k} \binom{n-1}{k-1} = \frac{n(n-1) \cdots (n-(k-1))}{k(k-1) \cdots (k-(k-1))} \binom{n-k}{0}.$$

Since

$$\begin{aligned} P(X=0) &= \binom{n}{0} q^n = P(Z_1 + \cdots + Z_n = 0) = P(Z_1 = \cdots = Z_n = 0) \\ &\stackrel{\perp}{=} P(Z_1 = 0) \cdots P(Z_n = 0) \stackrel{\text{identical}}{=} P(Z = 0)^n = q^n, \end{aligned}$$

then $\binom{n}{0} = 1$ and thus

$$\binom{n}{k} = \frac{n(n-1) \cdots (n-(k-1))}{k(k-1) \cdots (k-(k-1))} = \frac{n^{(k)}}{k!} = \frac{n!}{k!(n-k)!}.$$

□

Property 4.11. $\mathbb{E}[X^{(r)}] = \begin{cases} n^{(r)} p^r, & r = 0, \dots, n \\ 0, & r = n+1, \dots \end{cases}$.

Proof. Let $g(X) = X^{(r)} = X(X-1) \cdots (X-(r-1))$, we have $P(X=k) = \binom{n}{k} p^k q^{n-k}$. Hence

$$\begin{aligned} \mathbb{E}[X^{(r)}] &= \mathbb{E}[g(X)] = \sum_{k=0}^n g(k) p(k) = \sum_{k=0}^n k^{(r)} \frac{n^{(k)}}{k!} p^k q^{n-k} \\ &= \sum_{k=r}^n \frac{n^{(k)}}{(k-r)!} p^k q^{n-k} = n^{(r)} p^r \sum_{k=r}^n \frac{(n-r)!}{(k-r)!(n-k)!} p^{k-r} q^{n-k} \\ &= n^{(r)} p^r \sum_{j=0}^N \frac{N!}{j!(N-j)!} p^j q^{N-j} = n^{(r)} p^r, \end{aligned}$$

when $r = 0, \dots, n$.

□

Example 4.11. $X^{(2)} = X(X - 1) = X^2 - X$ and $\mathbb{E}[X^{(2)}] = n^{(2)}p^2 = \mathbb{E}[X^2] - \mathbb{E}[X]$. Therefore, $\mathbb{E}[X^2] = n^{(2)}p^2 + np$.

Example 4.12. Let $Z_i \stackrel{\text{independent}}{\sim} \text{bin}\left(i, \frac{2}{3}\right)$, $X = (Z_1 + 3Z_2 - 2Z_3)^2$.

We have

$$\begin{aligned}\mathbb{E}[X] &= \text{Var}[Z_1 + 3Z_2 - 2Z_3] + (\mathbb{E}[Z_1 + 3Z_2 - 2Z_3])^2 \\ &= 1 \times \frac{2}{3} \times \frac{1}{3} + 9 \times 2 \times \frac{2}{3} \times \frac{1}{3} + 4 \times 3 \times \frac{2}{3} \times \frac{1}{3} + \left(\frac{2}{3} + 3 \times 2 \times \frac{2}{3} - 2 \times 3 \times \frac{2}{3}\right)^2 = \frac{22}{3}.\end{aligned}$$
